

AMENDMENTS TO THE CLAIMS

This listing of claims replaces all prior versions and listings of claims in the application:

Listing of Claims:

- 1-21. (Cancelled)
22. (Currently Amended) A surface and cordless transducer system, the system comprising:
~~a surface, the surface including:~~
at least one transmitting coil for radiating an electromagnetic field to a transducer to power the transducer, the at least one transmitting coil having a resonant frequency;
position resolving grid, the position resolving grid distinct from the at least one transmitting coil, the position resolving grid configured to receive a position signal from the transducer to determine the position of the transducer;
and wherein the transducer comprises:
a resonant circuit, the resonant circuit configured to receive the electromagnetic field from the ~~at least one transmitting coil-surface~~ and store energy from the received electromagnetic field.
23. (Previously Presented) The surface and cordless transducer system of claim 22 wherein the position signal is transmitted by the transducer resonant circuit to the position resolving grid.

24. (Currently Amended) The surface and cordless transducer system of claim 23 wherein the position signal is pulse width encoded to transmit data from the transducer ~~to the surfacee~~.

25. (Previously Presented) The surface and cordless transducer system of claim 22 wherein the transducer comprises a second resonant circuit, and wherein the position signal is transmitted by the second resonant circuit to the position resolving grid.

26. (Currently Amended) The surface and cordless transducer system of claim 25 wherein the signal transmitted by the second resonant circuit is pulse width encoded to transmit data from the transducer ~~to the surfacee~~.

27. (Previously Presented) The surface and cordless transducer system of claim 25 wherein the second resonant circuit has a different resonant frequency than the resonant circuit.

28. (Previously Presented) The surface and cordless transducer system of claim 22 wherein the transducer resonant circuit transmits the position signal to the position resolving grid in response to a sync signal transmitted on the at least one transmitting coil.

29. (Currently Amended) The surface and cordless transducer system of claim 22 ~~wherein the surfacee further includes further comprising~~ a transmission controller, the transmission controller configured to selectively turn on the transmit signal source to provide a pulse width encoded signal for transmitting information to the transducer.

30. (Previously Presented) The surface and cordless transducer system of claim 29 wherein the transducer further includes control logic, the control logic configured to determine the pulse width encoded signal from the received electromagnetic field and selectively control the transducer in response to the pulse width encoded signal.

31. (Previously Presented) The surface and cordless transducer system of claim 22 wherein the transducer further includes control logic, and wherein the control logic of the transducer is further configured to vary the length of the position signal from the transducer.

32. (Previously Presented) The surface and cordless transducer system of claim 22 wherein the at least one transmitting coil comprises a plurality of overlapping coils.

33. (Currently Amended) The surface and cordless transducer system of claim 22 wherein the transducer has an active condition and a standby condition, and wherein the transducer resonant circuit in the standby condition resonates in response to the electromagnetic field ~~from the surface~~, and responsive to receipt of a sync signal ~~from the surface~~, the transducer is put in an active condition to vary the length of the position signal from the transducer.

34. (Currently Amended) The surface and cordless transducer system of claim 22 wherein the transducer further includes an oscillator that activates a tuned circuit in response to the receipt of a sync signal ~~from the surface~~ to transmit a pulse width encoded electromagnetic signal ~~to the surface~~.

35. (Currently Amended) The surface and cordless transducer system of claim 22 further comprising a wherein the surface further includes transmit signal source, the transmit signal source providing a powering signal to drive the at least one transmitting coil.

36. (Currently Amended) The surface and cordless transducer system of claim 22 further comprising wherein the surface further includes a means for squelching the at least one transmitting coil when the at least one transmitting coils are not transmitting

37. (Previously Presented) The surface and cordless transducer system of claim 22 wherein the transducer resonant circuit has a resonance frequency different from the resonant frequency of the at least one transmitting coil.

38. (Currently Amended) The surface and cordless transducer system of claim 22 wherein the transducer further comprises an oscillator, the oscillator configured to drive the resonant circuit with an oscillator signal to generate and transmit the position signal ~~to the surface~~.

39. (Previously Presented) The surface and cordless transducer system of claim 38 wherein the oscillator signal has a frequency different from the first resonant frequency.

40. (Currently Amended) A surface and cordless transducer system, the system comprising:

a surface, the surface including:

at least one transmitting coil for radiating an electromagnetic field to a transducer to power the transducer;

a transmit signal source, the transmit signal source providing a powering signal to drive the at least one transmitting coil;

a transmission controller, the transmission controller configured to selectively turn on the transmit signal source to provide a pulse width encoded signal for transmitting information to the transducer;

position resolving grid, the position resolving grid distinct from the at least one transmitting coil, the position resolving grid configured to receive a position signal from the transducer to determine the position of the transducer;

and wherein the transducer comprises:

a resonant circuit, the resonant circuit configured to receive the electromagnetic field from the at least one transmitting coil surface and store energy from the received electromagnetic field;

control logic, the control logic configured to determine the pulse width encoded signal from the received electromagnetic field and selectively control the transducer in response to the pulse width encoded signal.

41. (Previously Presented) The surface and cordless transducer system of claim 40 wherein the pulse width encoded signal transmits a command to update a transducer ID to the transducer.

42. (Previously Presented) The surface and cordless transducer system of claim 40 wherein the pulse width encoded signal transmits a mode select command to the transducer.

43. (Previously Presented) The surface and cordless transducer system of claim 40 wherein the pulse width encoded signal transmits an enable command to the transducer.

44. (Previously Presented) The surface and cordless transducer system of claim 40 wherein the pulse width encoded signal transmits a load command to the transducer.

45. (Previously Presented) The surface and cordless transducer system of claim 40 wherein the pulse width encoded signal transmits an update encryption data command to the transducer.

46. (Previously Presented) The surface and cordless transducer system of claim 40 wherein the pulse width encoded signal transmits a clock to the transducer.

47. (Previously Presented) The surface and cordless transducer system of claim 40 wherein the pulse width encoded signal transmits binary “1”s and “0”s to the transducer.

48. (Previously Presented) The surface and cordless transducer system of claim 40 wherein the resonant circuit is further configured to transmit the position signal to the position resolving grid.

49. (Previously Presented) The surface and cordless transducer system of claim 40 wherein the control logic of the transducer is further configured to vary the length of the position signal from the transducer.

50. (Previously Presented) The surface and cordless transducer system of claim 40 wherein the control logic of the transducer is further configured to vary the length of the position signal from the transducer to transmit pressure data to the position resolving grid.
